

Keep every user secure and connected, in every cloud, with Cisco SASE

their organizations secure, reduce operational costs, and make things simpler to manage. But it's not easy when:

IT teams are under more pressure than ever before to keep

76%

of IT teams say that remote workers are harder

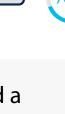

workers to company resources.2 of IT leaders agree or strongly agree that managing

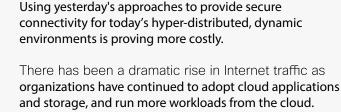

a multi-vendor networking and security stack is too complex.3

of organizations are having problems connecting

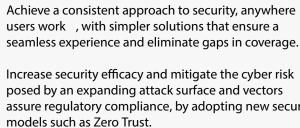

to secure.1

Backhauling traffic to corporate data centers via expensive MPLS lines and VPNs and forcing it through security appliances before forwarding it on no longer makes sense.

With many people working anywhere, on any device—at home, on the go, at the branch or campus offices-networking and security

Network operations teams Security teams

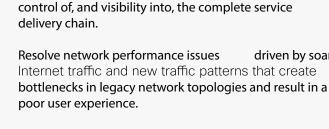

teams must:

assure regulatory compliance, by adopting new security models such as Zero Trust.

Reduce complexity and the risk of human error security stacks evolve to support faster adoption of cloud infrastructure and software as a service (SaaS).

Security and networking teams can't handle these challenges alone. They've got to come together to:

to

Reduce operational costs

associated with providing secure connectivity between complex IT environments (public, private, and hybrid clouds), using SD-WAN with end-to-end traffic modelling for optimal routing.

Support an excellent hybrid workforce experience

ensuring optimal connectivity to any cloud and improving

Control costs Simplify operations Keep their organization secure

access to authorized applications.

Cloud Access Security Broker (CASB)

Remote Browser Isolation (RBI)

Secure access service edge (SASE) converges networking (SD-WAN), cloud-based security (CASB, FWaaS, SWG, and ZTNA), analytics, and insights into a single, cloud-based solution, delivered as a service, to provide optimal, secure connectivity from every user and

Cloud security Zero Trust Network Access (ZTNA) A security framework that mitigates unauthorized access, contains breaches, and reduces attackers' lateral movement across the network. ZTNA should be coupled with strong identity and access management to verify users' identity and establish device trust before granting

Software-based, cloud-deployed services that help manage and inspect network traffic.

and uploads, to be blocked. Data Loss Prevention (DLP) Software that analyzes data in-line to provide visibility and control over sensitive data being pushed or pulled

beyond the organization's network or cloud environment.

enabling risky SaaS apps and specific actions, like posts

Software that detects and reports on cloud applications

in use across a network, exposing shadow IT and

Software that isolates web traffic from user devices to mitigate the risk of browser-delivered threats. **DNS-layer security** Software that acts as the first line of defense against threats on the Internet, blocking malicious DNS requests

before a connection to an IP address is even established.

Strong DNS security can greatly reduce the number of

Threat researchers, engineers, and data scientists who

threats a security team has to triage on a daily basis.
